Version 1.0.2 - April 30, 2017

- Add version with slider on home screen.
- Add version with parallax image on home screen.
- Add version with video background on home screen.
- Minor improvements.

2. Theme setup

2.1. General structure

- **/app** - source files (non-minified assets, source LESS files)
 - /assets/bootstrap - original Bootstrap files
 - /assets/css - compiled CSS files
 - /assets/fonts - fonts
 - /assets/ico - favicon images
 - /assets/img - image assets
 - /assets/video - video assets
 - /assets/js - JS scripts
 - /assets/less -source LESS styles
 - /assets/plugins - plugins used throughout the theme
- **/dist** - ready for production files. This is the folder that you need if you don't want to work on the source files.

2.2. Files compilation

If you prefer to work on the source LESS files, please follow the steps below:

1. Open a command line from the /admin folder.
2. Run *npm install* to install required dependencies (taken that you have node.js installed on your machine).
3. Once everything is installed, run one of the commands below. Available commands:
 - a. *gulp* - to make an initial compilation and start watching for changes in LESS files. This will also start a local server and a localhost:3000 page you will be able to preview changes in.
 - b. *gulp build* - to compile files for production. This will compile LESS files to CSS and minify assets.

2.3. Color schemes

If you need a different color scheme, you need to modify source LESS files. Please, follow the steps below:

- Perform the steps, described in p. [2.2](#).
- Open to */app/assets/less/components/colors.less* in your favourite text editor.

- Change the value of the `@brand-primary` variable to your preferred color.
- Save the file and run `gulp build` to build the `/dist` folder again.

2.4. Photos

All photos in the preview are not included into the download file. Please follow the steps below in order to replace them with your custom images:

- `index.html`
Please find an `` tag that you need and replace its `"src"` attribute content with an actual link to your image (e.g. ``).
- `styles.css`
Please find a selector that you need and replace its `"url"` value content with an actual link to your image (e.g. `background: url("../img/your_photo.jpg");`).

2.5. Contact form

This template contains a fully functioning PHP contact form with spam protection powered by reCaptcha.

Note: The contact form will not work in your local environment without a server that supports PHP.

In order to set up the contact form, please follow the steps below:

1. Open the `/config.php` file and fill out the required information:

- reCaptcha Public (`$publickey`) and Private (`$privatekey`) keys.
These keys are required to make your reCaptcha work properly. Please go to <https://www.google.com/recaptcha/admin/create> if you don't have the keys yet.
- Sender name and email address (`$mail_sender`)
This is a name and email address you will see in the 'From:' line of new emails you will receive.
- Your email address (`$to_email`)
This is an email address new emails will be sent to.

- Email subject (\$mail_subject)

This is a subject of new emails you will receive.

2. Open your /index_*.html file and insert your reCaptcha Public key (see Step 1) in this line:

```
<div class="g-recaptcha" data-sitekey="YOUR_SITE_KEY"></div>
```

3. Save both files.

Thanks for purchasing Sunset Hotel theme. Do not hesitate to contact us if you have any questions or suggestions regarding this item.
